Abstract: The Uttara Kannada forests are rich in biological diversity both with respect to flora and fauna. The rural households in this district possess traditional knowledge about the use of indigenous fruits which are season specific. To gather traditional knowledge on fruit and their use, a study was conducted on consumption of these fruits by the Farm households of different geographic zones across the Uttara Kannada district. An attempt was also made for documentation of recipes prepared indigenously by farm women of different regions. The results revealed that different fruit parts used in the reported recipes were unique fruits and ripe fruit pulp, seed and fruit rind though the list is not exhaustive. Upahat region represented highest recipes (33) and coastal region was on par with the upahat region (31). Eastern plains recorded lowest number of recipes (5). Famous jackfruit dosa was reported from coastal region. The recipe for mango appu huli was not reported in eastern plains, it was however recorded from coastal and upahat region. The study concludes that coastal and upahat zones have more number of recipes compared to eastern plains, therefore these zones may called centers of traditional knowledge on indigenous fruit trees. We also suggest that further studies are required for socio-economic and cultural linkage analysis in this region.

Keywords: Uttara Kannada, Fruit trees, Recipes, Indigenous knowledge
